

ASE 230 Tools Installation - PHP

Windows Users

Install PHP **inside WSL2**, not on Windows directly.

See "02.install_ase230_tools_with_wsl2.md" first, then run the commands
below in your Ubuntu terminal.

Run This Automatically Instead

A `run.sh` is just a script — a text file listing the same commands

you'd otherwise type by hand — that runs them all for you in one step. This one captures everything below (install, extensions, Composer, verify), with Mac/Linux(WSL2) handled automatically. See

`code/03. php installation/readme.txt` for more on what it does and why.

```
cd "code/03. php installation"  
bash run.sh
```

(`code/03. php installation/run.sh`)

macOS

```
# Install Homebrew if you don't have it:  
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"  
  
brew install php  
php -v
```

Linux / WSL2 (Ubuntu)

```
sudo apt update  
sudo apt install php php-cli php-mysql  
php -v
```

Verify the Install

```
php -v

# quick test server
echo "<?php phpinfo(); ?>" > info.php
php -S localhost:8000
# Visit http://localhost:8000/info.php
# Press Ctrl+C to stop the server.
```

Common Extensions Used in This Course

```
sudo apt install php-curl php-json php-mbstring php-xml php-zip
```

Composer (PHP Package Manager)

```
curl -sS https://getcomposer.org/installer | php  
sudo mv composer.phar /usr/local/bin/composer  
composer --version
```

Editor: VS Code

Open your project folder directly in VS Code. Recommended extensions:

- PHP Intelephense (autocomplete, error checking)
- PHP Debug

Troubleshooting

php: command not found

Add PHP to `PATH`, restart terminal.

Extension not loading

```
php -m          # list loaded extensions  
php --ini       # show config file used
```
