

Module 3 — Run and Publish Your Project

Run your Server API and publish its documentation

Build on Module 2

- Laravel routes and controllers handle API requests.
- Eloquent models work with MySQL records.
- Migrations define the database structure.
- Sanctum protects the endpoints that require authentication.

Module 3 packages this work and explains how to run it.

In Module 3

Deployment	Where it runs
Laravel API + MySQL	Docker
Hugo documentation + portfolio	GitHub Pages

- GitHub Pages serves static files.
- It does not run Laravel, PHP, or MySQL.

The Key Automation: Push = Deploy

The most important automation in Module 3:

```
edit → commit + push → GitHub Actions builds Hugo → your site updates
```

- After the one-time setup, you never build or copy files again.
- Pushing your Hugo source is all it takes to update your website.

Install Module 3 Tools

1. `1_Docker` : Install Docker (docker_installation.pdf)
2. `2_Hugo` : Install Hugo (hugo_installation.pdf)
3. `3_Github_io` : Create your GitHub Pages repository (githubio_installation.pdf)

Project 2 requires automatic publishing with GitHub Actions.

Find the Materials

Paths are relative to `module3/` :

- `src/` : lesson slides in Markdown.
- `code/` : scripts, configuration, and example content.
- `questions/` : review questions.

Copy an example folder into a practice directory before changing it.

Prepare and Check (Install Docker and Hugo)

- Start Docker Desktop; on Windows, enable its WSL2 integration.
- Use Terminal on macOS or Ubuntu in WSL2 for the shell scripts.
- Check `docker version`, `docker compose version`, `hugo version`, and `git --version`.
- Have a GitHub account and a repository for your Hugo site (Module 1).
