

Hugo Installation

Install Hugo. Then continue with
[Getting Started with Hugo](#)
to run the course portfolio example.

Learning Goals

- Install Hugo in the terminal where you run course commands.
- Verify the installation with `hugo version`.

Install Hugo Where You Run It

Computer	Install Hugo in	Run course commands in
Windows	Your WSL2 distribution	The same WSL2 terminal
macOS	macOS	Terminal

A Hugo installed in Windows PowerShell is not available inside WSL.

macOS: Install with Homebrew

```
brew install hugo
```

No Homebrew? Install it from brew.sh, then run the command above.

Windows: Install in WSL2

In your WSL2 terminal (Ubuntu or Debian):

```
sudo apt update  
sudo apt install -y hugo
```

The package may be older than the newest Hugo. The course example works with it.

Check the Result

```
hugo version
```

Computer	Output starts with
macOS	hugo v0.167.0+extended+withdeploy
WSL2	hugo v0.123.7+extended

Your version number may differ. The course example works with v0.123.7 and newer.

If Hugo Is Not Found

If you see `hugo: command not found`, you are probably in a different terminal than the one where you installed Hugo. Open the terminal from the first table and run `hugo version` again.
